

Proofing Tools for NeoOffice 2.0 (Intel) - Installation Instructions

Fri, 28/11/2008 - 16:09 — webmaster

Installation Instructions

1. We assume that you have installed NeoOffice 2.0 for Mac OS X on Intel platform and that you have run it at least once (so as its running parameters have been initialized).
2. Download the archive [npt4oomaci386.zip](#) [1], which contains the speller, hyphenator and thesaurus engines of NeoOffice for Intel platform, and unzip it with the command:
unzip npt4oomaci386.zip
A folder with name macosx_i386.plt will be created, containing the files neuro_el_spell_1.0.uno.dylib, neuro_el_hyph.1.0.uno.dylib and neuro_el_thes.1.0.uno.dylib.
3. In the dicts folder of the CD-ROM with the [Proofing Tools for NeoOffice](#) [2] you will find the three dictionaries used by the speller, hyphenator and thesaurus engines, i.e. the files sp_el_GR.dic, hp_el_GR.dic and th_el_GR.dic. Copy these files into the folder ~/Library/Preferences/NeoOffice-2.x/user/workbook.
4. Start up NeoOffice and select the menu "Tools/Package Manager" or "Tools/Extension Manager". In the dialog window that appears, choose "MyPackages" and click "Add". The well known file-picking dialog will appear. Locate the folder macosx_i386.plt (which you created in the 2nd step) and pick up the file neuro_el_spell_1.0.uno.dylib. As a result, NeoOffice will install the speller engine. Repeat the procedure for the files neuro_el_hyph.1.0.uno.dylib and neuro_el_thes.1.0.uno.dylib found in the folder macosx_ppc.plt, thus installing the hyphenator and thesaurus engines.
5. Quit NeoOffice and start it up again. Select the menu "Tools/Options" and locate the option "Language Settings/Writing Aids", where you can activate the three proofing tool engines (see section **Manual Installation**, Step 4, in the CD-ROM installation instructions).
