

Speller

Fri, 16/05/2008 - 17:24 — webmaster

Characteristics

The basic characteristics of Neurolingo's Speller for Modern Greek are:

- It uses a main dictionary and several secondary dictionaries. The main dictionary contains common Modern Greek words, coming from Neurolingo's [Morphological Lexicon](#) [1] (~1.200.000 wordforms), which is enriched on a daily basis with new words taken from a constantly evolving corpus of newspaper and literature texts as well as from reports of Speller's users. Secondary dictionaries pertain to domain-specific vocabularies (e.g. a dictionary with ~10.000 Greek place names) or foreign language vocabularies (e.g. an English dictionary with 200.000 wordforms). The foreign language dictionaries are used for the treatment of multilingual texts (e.g. Greek-English) in text processing environments that lack language detection (e.g. MS Outlook/Excel/Access, Mozilla Thunderbird, etc.); that is, apart from Greek text, Neurolingo's speller is able to process English (and soon French) text.
- The engine that searches for spelling alternatives is based on special data structures and algorithms and is (~10 times) faster than the corresponding engine of the English speller of MS Office.
